

Pulse. Your event's data, finally **working** for you.

Howler is the Experience Operating System for live events, and Pulse is our new flagship product: one white-label platform that turns your ticketing, cashless and web data into **insight** → **action** → **results**. Live dashboards, an AI analyst that explains your numbers, scheduled briefings, and a full email/SMS campaign engine, all powered by the same governed data, all scoped to you, all in your brand, all on your phone.

One loop that never stops turning · **not five disconnected tools**

Live data lands

Ticketing, cashless and web analytics flow in continuously, no exports, no spreadsheets.

The Owl reads it

AI briefings and digests tell you what changed *and what to do about it*.

You act

Turn a suggestion into a branded email/SMS campaign to the exact segment, in a click.

Results come back

Opens, clicks, conversions and revenue tracked per recipient, straight into your dashboards.

The loop tightens

Results shape the next briefing and the next suggested action. Every cycle is sharper.

▶ ▶ ▶ **insight** → **action** → **results** → **improvement, on repeat** ▶ ▶ ▶

vs. a dashboard tool

Dashboards show you the problem, then leave. Pulse **acts** on the data: campaigns, approvals, ad-audience sync, in the same place you saw it.

vs. an email tool

No list gymnastics. Pulse audiences come straight from your **live ticketing data**, stay current automatically, and are governed & scoped to you.

vs. doing it manually

An installable app that **pings your phone** when a number matters, a nudge lands, you tap, you're in the right place to act. No logging in to check.

"It's not dashboards and email and reports, it's one living loop. Your data tells you what to do, you do it in the same place, and the result makes the next call smarter. The longer you use Pulse, the better it gets."

Live dashboards with the Owl one tap away. Screens are illustrative; the numbers are Milk & Cookies' real Pulse data, pulled live on 9 July 2026.

ONE PARTNER, END TO END

The Howler One stack · one experience, one dataset

Pulse isn't a bolt-on, it's the intelligence layer of **Howler, the Experience Operating System: one connected stack** that runs your entire event: selling the ticket, taking the payment, hosting the VIP, and putting the whole experience in the fan's pocket. Every layer feeds the same dataset, and Pulse turns that dataset into action.

"Most organisers run four vendors and five spreadsheets. With Howler it's one stack, and because it's one stack, the data compounds: every layer makes every other layer smarter."

Everything an organiser needs, in one place

SEE · dashboards & AI insight know what's happening, without digging

Live dashboards: KPIs, tables and charts on your real ticketing & web data, with drill-through. Mobile-first and installable as an app.

Per-tile AI insight: tap any tile and the Owl explains the numbers and answers follow-ups, grounded in that data.

Share any insight: hand a finding to email, WhatsApp or Slack in one tap, with a link back to the view.

Personalised AI briefing: land on a plain-English summary of what matters right now, tailored to what you follow.

Scheduled digests: role-specific email briefings (exec / marketing / finance / ops) on your cadence, with charts rendered in the email.

Goals with pace & forecast: set a North Star target; every screen shows ahead / on-track / behind vs last event's real sell-curve, with a projected landing.

"Your data, read for you, open the app and you already know what changed and what to do."

ASK · your AI Data Analyst, everywhere plain-language answers, only from your data

Ask the Owl in-app: "what's on sale right now?", "how does this compare to last year?", conversational answers scoped to your data.

Reads your own documents: share budgets, marketing plans or sponsor decks and the Owl answers from them alongside live sales data.

The Owl on WhatsApp: message the Owl from your own WhatsApp: answers, charts as images, tappable follow-ups, daily updates, even draft a campaign by reply button.

Take action by chat: the Owl doesn't just answer: it can set up an alert, save a segment or draft a campaign straight from the conversation, with a confirm step before anything is created.

"Ask your data anything, in plain language, your own analyst, in your pocket."

ACT · Engage, the campaign engine from seeing a cohort to reaching it, in one click

Live segments: build audiences from a dashboard tile, an uploaded list, or a linked sheet; combine them (add, overlap, exclude, e.g. abandoned carts *minus* already-called). Always current at send time.

Drip automations: abandoned-cart recovery journeys that catch new abandoners in real time, stop automatically when someone buys, and show a per-step conversion waterfall.

Approvals & consent built in: nothing sends without explicit approval; POPIA-aware consent enforced per channel; send caps stop costly mistakes.

Email & SMS campaigns: AI-drafted copy, a drag-and-drop block builder, AI-designed layouts & banners, merge fields, promo codes, full open/click tracking.

Ad-platform sync: push a segment to your ad accounts as a privacy-safe custom audience, kept in sync automatically; see spend, ROAS and paid results next to ticket sales.

Owl auto-pilot: one tap turns an AI suggestion into a drafted campaign; it still rides the normal review + approval gates.

"Personalised, on-brand email + SMS to a precise audience, with approval gates and real tracking, all from the same data."

📧 🌞 Your Friday briefing · Milk & Cookies

from Milk & Cookies via Pulse · Fridays 07:00 · to the exec team

Morning! The short version: M&C JHB | 26 stands at 17 812 tickets, 99% of the 18 000 goal, with R18.96m gross. General Access Phase 1 leads (2 877); Golden Circle holds 1 782. 188 tickets to go.

SUGGESTED ACTIONS

- **Recover the 3 396 abandoned carts:** 188 sales closes the goal
- **Send "Everyone's going. Are you?" 🤖** to the 18–22 audience (1 775 reachable)
- **Set the sell-out alert** at 18 000 tickets

The scheduled digest, built on Milk & Cookies' live numbers: a role-specific read of the week, with the next actions attached.

MEET YOUR TEAM WHERE THEY ARE

One brain. Every channel.

At the centre sits **the Owl, one brain** that knows your events, your sales and your audiences. Around it, the doors your team already uses every day. Same answers, same security boundary, whichever door you walk through.

How big is our abandoned-cart audience, and where are we against the ticket goal?

Your **Abandoned carts** segment holds **3 396 contactable people**. Ticket sales stand at **17 812 of the 18 000 North Star (99%)**, with General Access Phase 1 the top seller at 2 877.

in your AI assistant · scoped to your events

One brain, one boundary

Every door goes through the same server-side scope gate: the Owl answers **only your events**, grounded in your data, it quotes, it never invents. Keys are read-only and revocable per client.

Ask on the couch, at the gate, or at your desk, same Owl, same answer.

Open the app on the way to the site, WhatsApp the Owl from the gate, or ask your AI assistant from the office, every door leads to the same brain, reading the same live data. And when something matters, the Owl doesn't wait to be asked: it pushes the briefing, the digest and the alert to whichever screen you're on.

The marketer's dream, on one platform

Everything a growth marketer normally stitches together across five subscriptions, audiences, journeys, ad platforms, creative, attribution, running on **one live, governed dataset**. No exports. No stale lists. No copy-paste between tools.

Audiences that never go stale

Build a segment from a dashboard tile, a sheet or a list, it **re-resolves live at send time**. Combine sources (add, overlap, exclude), subtract suppression lists, filter on any column: ticket type, city, age, spend.

Live data → your ad accounts

Push any segment to **your ad accounts as a privacy-safe custom audience**: kept in sync daily, leavers removed automatically. Exclude buyers from prospecting. Then see **spend, CPC and ROAS next to actual ticket sales**.

Complex journeys, simple setup

1 · Reminder email		3 396 enrolled
2 · +4h nudge		58% opened
3 · +24h promo SMS		31% clicked

✓ 188 recoveries would close the 18 000 goal · buyers auto-exit

Your real Abandoned carts segment (3 396 people) worked automatically: timed steps, per-step copy and promo, true real-time enrolment. Step rates shown are illustrative.

✨ An AI creative studio inside

The Owl drafts the copy, designs the **whole themed email layout**, and draws **on-brand banners** from a one-line prompt. Pick a theme, tweak in the drag-and-drop builder, save as a template. Any campaign in any language.

Attribution you can defend

Per-recipient **opens, clicks and tracked purchases**; tracked links on every send; unique-per-person promo codes that tie a sale to a send. Campaign results flow back into the same dashboards you plan from.

Guardrails a CMO will love

Approval gates before anything sends, POPIA-aware per-channel consent, one-click unsubscribe, audience and SMS **send caps** so a big blast never becomes an expensive accident.

"From seeing a cohort on a dashboard to a live journey, an ad audience and tracked revenue, without leaving the platform or exporting a single spreadsheet. That's the whole pitch."

Contact details are protected before they ever leave Pulse, the ad platforms never see raw personal data.

The Owl designs the email (that subject line is a real draft in your account); the audiences are your real segments, mirrored daily.

Event Ops · your operations command centre

A live overview of how the whole event is **flowing**: the gates, the bars, the devices, the data itself. Replaces the clipboard, the spreadsheet and the frantic WhatsApp group with one phone-first console.

The live overview: one board with the whole operation: device counts by state, per-station deployment, open issues and a live activity feed. The "where is everything right now" view.

Every device tracked: scanners, payment devices, radios, printers: bulk-register a batch, then **scan to move** between the store and stations. Every move lands in a tamper-proof audit trail, nothing is lost to memory, and every device is accounted for at event close.

Hotspots & the heat map: every station's activity in time blocks: watch the crowd move from gates to bars, spot the overloaded station and the dead one, staff accordingly.

Bar & operator performance: every bar and every bartender, live: sales and rands-per-hour per operator, who's flying and which till has gone quiet. Praise the stars at the debrief; fix the slow lane before the queue grows.

Connectivity & data health: is data from every station actually arriving? Minutes-since-last-record per station with alerting when a stream goes quiet; a device roster showing exactly **which units are offline and for how long**. You'll know a scanner died before the queue does.

AI Diagnose + event report: one-tap AI verdicts per station, and a post-event diagnostics report clean enough to forward to the network provider.

Live updates & alerts: compact multi-metric updates while doors are open (gates pace, bar revenue, top vendors, device health) straight to your phone, plus threshold alerts on any number that matters.

Your venue's own site plan, live: every station pinned, heat showing where the crowd is spending right now, and a dark station flagged the moment its data stops flowing.

Bar & operator performance, live: the lane's width is money flowing through that operator's till. Thabo is carrying Main Bar; Kea's lane has run dry, someone should check till 3. Names illustrative; the view is real.

Your brand. Your data. Your platform.

 **RUN · the everyday relationship** everything with Howler, in one tracked place

Messaging inbox: a two-way client ↔ Howler inbox with read/acknowledge trails; important notes and approvals stop living in scattered WhatsApps.

Status notices: if anything's ever up with the platform, you see a proper status timeline in-app and hear about it before you have to ask.

Settlements that read themselves: settlement PDFs become clean interactive statements; CC the Owl on the email and it checks the totals and files them automatically.

Documents in one place: every event's settlements and documents together, searchable, next to the numbers they explain.

 **OWN · white-label, security & openness** your brand, your accounts, your data

Fully white-label: your logo, colours and sender name everywhere; emails from your own domain; even a vanity login page that feels like *your* product.

Watertight data scoping: every query is force-filtered to your events server-side; it can't be bypassed and fails closed. One client can never see another's data.

Open by design: read-only, per-client keys; connect the AI assistant of your choice to your data. Never locked in.

Your language & currency: AI insights, briefings, digests and campaign copy in your reporting currency and your choice of language.

POPIA-minded by design: per-channel consent, one-click unsubscribe, protected identities for ad sync, no cross-client data pooling.

Self-service, with backup: manage everything yourself in Settings, or your Howler team does it for you; your named contacts are one tap away.

If you're using...	The gap	What Pulse changes
A dashboard tool	You see the problem, then export the data and switch tools to act on it.	See it and act on it in the same governed place, campaign, approval, result.
An email tool	Audiences go stale the moment you upload them.	Audiences built from live ticketing data that re-resolve at send time.
Email + chat threads	Approvals, settlements and "did you see this?" get lost.	One inbox with read/ack trails; settlements that file themselves.
Gut feel on event night	You find out about problems when the queue does.	A live ops board, alerts, and a mini report every 30 minutes, on your phone.

The pitch, in one line

See what's happening, act on it, and prove the results, on your phone, in your brand, without exporting to five tools.
Insight → action → results → improvement, on a loop, in one governed place.
