

HOWLER PRESENTS

Pulse. Your event's data, finally **working for you.**

Pulse is the Experience OS for event organisers — one white-label platform that turns your ticketing, cashless and web data into **insight** → **action** → **results**. Live dashboards, an AI analyst that explains your numbers, scheduled briefings, and a full email/SMS campaign engine — all powered by the same governed data, all scoped to you, all in your brand, all on your phone.

One loop that never stops turning — **not five disconnected tools**

Live data lands

Ticketing, cashless and GA4 flow in continuously — no exports, no spreadsheets.

The Owl reads it

AI briefings and digests tell you what changed *and what to do about it*.

You act

Turn a suggestion into a branded email/SMS campaign to the exact segment — in a click.

Results come back

Opens, clicks, conversions and revenue tracked per recipient — straight into your dashboards.

The loop tightens

Results shape the next briefing and the next suggested action. Every cycle is sharper.

▶ ▶ ▶ **insight** → **action** → **results** → **improvement, on repeat** ▶ ▶ ▶

vs. a BI tool (Looker / Tableau)

Dashboards show you the problem, then leave. Pulse **acts** on the data — campaigns, approvals, ad-audience sync — in the same place you saw it.

vs. an email tool (Mailchimp / Klaviyo)

No CSV gymnastics. Pulse audiences come straight from your **live ticketing data**, stay current automatically, and are governed & scoped to you.

vs. doing it manually

An installable app that **pings your phone** when a number matters — a nudge lands, you tap, you're in the right place to act. No logging in to check.

"It's not dashboards and email and reports — it's one living loop. Your data tells you what to do, you do it in the same place, and the result makes the next call smarter. The longer you use Pulse, the better it gets."

Everything an organiser needs, in one place

SEE — dashboards & AI insight know what's happening, without digging

Live dashboards — KPIs, tables and charts on your real ticketing & GA4 data, with drill-through. Mobile-first and installable as an app.

Per-tile AI insight — tap any tile and the Owl explains the numbers and answers follow-ups, grounded in that data.

Share any insight — hand a finding to email, WhatsApp or Slack in one tap, with a link back to the view.

Personalised AI briefing — land on a plain-English summary of what matters right now, tailored to what you follow.

Scheduled digests — role-specific email briefings (exec / marketing / finance / ops) on your cadence, with charts rendered in the email.

Goals with pace & forecast — set a North Star target; every screen shows ahead / on-track / behind vs last event's real sell-curve, with a projected landing.

"Your data, read for you — open the app and you already know what changed and what to do."

ASK — your AI Data Analyst, everywhere plain-language answers, only from your data

Ask the Owl in-app — "what's on sale right now?", "how does this compare to last year?" — conversational answers scoped to your data.

Reads your Google Drive — share budgets, marketing plans or sponsor decks and the Owl answers from them alongside live sales data.

The Owl on WhatsApp — message the Owl from your own WhatsApp: answers, charts as images, tappable follow-ups, daily updates, even draft a campaign by reply button.

Fan Owl on your website — a booking-guide widget on your public event site: answers FAQs from your knowledge base, recommends the right ticket, links to your own checkout, and captures opted-in fans for remarketing.

"Ask your data anything, in plain language — your own analyst, in your pocket."

ACT — Engage, the campaign engine from seeing a cohort to reaching it, in one click

Live segments — build audiences from a dashboard tile, a CSV, or a linked Google Sheet; combine with union / intersect / exclude (e.g. abandoned carts *minus* already-called). Always current at send time.

Drip automations — abandoned-cart recovery journeys that catch new abandoners in real time, stop automatically when someone buys, and show a per-step conversion waterfall.

Approvals & consent built in — nothing sends without explicit approval; POPIA-aware consent enforced per channel; send caps stop costly mistakes.

Email & SMS campaigns — AI-drafted copy, a drag-and-drop block builder, AI-designed layouts & banners, merge fields, promo codes, full open/click tracking.

Ad-platform sync — push a segment to Meta or TikTok as a Custom Audience (privacy-safe, hashed), auto-synced daily; see spend, ROAS and paid results next to ticket sales.

Owl auto-pilot — one tap turns an AI suggestion into a drafted campaign; it still rides the normal review + approval gates.

"Personalised, on-brand email + SMS to a precise audience — with approval gates and real tracking, all from the same data."

MEET YOUR TEAM WHERE THEY ARE

One brain. Every channel.

The same governed data and the same Owl, reachable wherever your team (and your fans) already live. Nobody has to change how they work — Pulse comes to them.

The Pulse app

Mobile-first web app that installs like a native app and sends **push notifications even when closed** — a nudge lands, you tap, you act.

WhatsApp

Chat to the Owl from your own WhatsApp: answers, charts as images, daily updates, event-night mini reports, team broadcast lists.

ChatGPT & Claude

Connect Pulse to the AI tools you already use — ask about your events from ChatGPT or Claude, powered by the Pulse connector (MCP).

Email

Scheduled role-based digests, campaign sends from your own domain — and CC the Owl on a settlement email and it files itself.

SMS

Campaigns, urgent alerts and event-night reports by text — for the moments that can't wait for an inbox.

Slack

Mirror Pulse notifications into your team's Slack channel, and share any insight or tile straight into a conversation.

Your website

The Fan Owl widget turns your public event site into a guided ticket shop — answering, recommending and selling on every page.

The Howler portal

The Owl embedded inside Howler's organizer portal — ask about ticket sales without leaving the back end you use every day.

Works with the AI your team already uses

The Pulse connector plugs your event data into **Claude and ChatGPT** (including Deep Research). Your marketing lead can ask "which campaign converted best?" from the tool they already have open — same data, same security boundary, read-only, per-client keys you control.

How big is the VIP segment, and how did the launch campaign do?

Your **VIP Buyers** segment currently holds **1 842 contactable people**. The launch campaign reached 14 210, with a **38% open rate** and **612 tracked purchases**.

 via Pulse connector · scoped to your events

The marketer's dream, on one platform

Everything a growth marketer normally stitches together across five subscriptions — audiences, journeys, ad platforms, creative, attribution — running on **one live, governed dataset**. No exports. No stale lists. No copy-paste between tools.

Audiences that never go stale

Build a segment from a dashboard tile, a sheet or a list — it **re-resolves live at send time**. Combine sources (union / intersect / exclude), subtract suppression lists, filter on any column: ticket type, city, age, spend.

Live data → your ad accounts

Push any segment to **Meta or TikTok as a Custom Audience** — hashed before it leaves, mirrored daily, leavers removed automatically. Exclude buyers from prospecting. Then see **spend, CPC and ROAS** next to actual ticket sales.

Complex journeys, simple setup

1 · Reminder email		2 480 sent
2 · +4h nudge		58% opened
3 · +24h promo SMS		31% clicked

✓ 214 recovered purchases · buyers auto-exit the journey

Timed multi-step drips with per-step copy, promo and delays — true real-time abandoned-cart, or work an existing list forward.

An AI creative studio inside

The Owl drafts the copy, designs the **whole themed email layout**, and draws **on-brand banners** from a one-line prompt. Pick a theme, tweak in the drag-and-drop builder, save as a template. Any campaign in any language.

Attribution you can defend

Per-recipient **opens, clicks and tracked purchases**; UTM on every link; unique-per-person promo codes that tie a sale to a send. Campaign results flow back into the same dashboards you plan from.

Guardrails a CMO will love

Approval gates before anything sends, POPIA-aware per-channel consent, one-click unsubscribe, audience and SMS **send caps** so a big blast never becomes an expensive accident.

"From seeing a cohort on a dashboard to a live journey, an ad audience and tracked revenue — without leaving the platform or exporting a single CSV. That's the whole pitch."

One platform replaces the pile

✗ the email tool

✗ the SMS gateway

✗ the audience CSV uploads

✗ the attribution spreadsheet

✗ the weekly report deck

✓ one login · one dataset · one loop

And because every piece runs on the same governed data, each one makes the others smarter — the ad audience knows who already bought, the journey knows who converted, and the briefing knows what worked.

Event Ops — your operations command centre

A live overview of how the whole event is **flowing** — the gates, the bars, the devices, the data itself. Replaces the clipboard, the spreadsheet and the frantic WhatsApp group with one phone-first console.

 **The live overview** — one board with the whole operation: device counts by state, per-station deployment, open issues and a live activity feed. The "where is everything right now" view.

 **Every device tracked** — scanners, payment devices, radios, printers: bulk-register a batch, then **scan to move** between the store and stations. Every move lands in an append-only audit trail — nothing is lost to memory, and every device is accounted for at event close.

 **Hotspots & the heat map** — every station's activity through the day in time blocks: watch the crowd move from gates to bars, spot the station that's overloaded and the one that's dead — and staff accordingly, tonight and next year.

 **Connectivity & data health** — is data from every station actually arriving? Minutes-since-last-record per station with alerting when a stream goes quiet; a device roster showing exactly **which units are offline and for how long**. You'll know a scanner died before the queue does.

 **AI Diagnose + event report** — one tap per station gets an AI verdict with ranked concerns and a suggested fix; after the event, an AI-drafted diagnostics report for the debrief — with a connectivity section clean enough to forward to the network provider.

 **Live updates while doors are open** — a compact multi-metric report to the team every 15–120 minutes: people through the gates with pace per hour, bar revenue, top-3 vendors, device health, % of last year — to inbox, push, SMS and WhatsApp.

 **Alerts on any number** — "tell me when VIP drops below 100": Pulse watches it and taps you on the shoulder the moment it crosses. Cooldowns and quiet hours keep it calm.

"The crowd's flow, every device, every station and the data pipe itself — one live board. You'll know a hotspot is forming, or a scanner has died, before anyone on the ground has to tell you."

At event close

Every device accounted for — no "missing" unknowns, and a full history of where each one went, who moved it and what went wrong.

The whole night, one thread

Live updates stack into a single inbox thread — scroll the night's story at the debrief, from doors to last call.

Evidence, not arguments

If connectivity was the culprit, the AI report gives you a neutral, data-backed section you can forward straight to the network provider.

Your brand. Your data. Your platform.

 **RUN — the everyday relationship** everything with Howler, in one tracked place

Messaging inbox — a two-way client ↔ Howler inbox with read/acknowledge trails; important notes and approvals stop living in scattered WhatsApps.

Status notices — if anything's ever up with the platform, you see a proper status timeline in-app and hear about it before you have to ask.

Settlements that read themselves — settlement PDFs become clean interactive statements; CC the Owl on the email and it checks the totals and files them automatically.

Documents in one place — every event's settlements and documents together, searchable, next to the numbers they explain.

 **OWN — white-label, security & openness** your brand, your accounts, your data

Fully white-label — your logo, colours and sender name everywhere; emails from your own domain; even a vanity login page that feels like *your* product.

Watertight data scoping — every query is force-filtered to your events server-side; it can't be bypassed and fails closed. One client can never see another's data.

Open by design — read-only, per-client API keys; connect Claude or ChatGPT to your data. Never locked in.

Your language & currency — AI insights, briefings, digests and campaign copy in your reporting currency and your choice of language.

POPIA-minded by design — per-channel consent, one-click unsubscribe, hashed identities for ad sync, no cross-client data pooling.

Self-service, with backup — manage everything yourself in Settings, or your Howler team does it for you; your named contacts are one tap away.

If you're using...	The gap	What Pulse changes
Looker / Tableau	You see the problem, then export a CSV and switch tools to act on it.	See it and act on it in the same governed place — campaign, approval, result.
Mailchimp / Klaviyo	Audiences go stale the moment you upload them.	Audiences built from live ticketing data that re-resolve at send time.
Email + WhatsApp threads	Approvals, settlements and "did you see this?" get lost.	One inbox with read/ack trails; settlements that file themselves.
Gut feel on event night	You find out about problems when the queue does.	A live ops board, alerts, and a mini report every 30 minutes — on your phone.

The pitch, in one line

See what's happening, act on it, and prove the results — on your phone, in your brand, without exporting to five tools.
Insight → action → results → improvement, on a loop, in one governed place.

Ask your Howler account manager for a live demo →
